Local Device Storage Exercise

Problem 1 – Local Files

Description
Save the last viewed dog image and display it when the app is reopened.

Requirements

- Utilize the previously completed dog image gesture app
- Update the app so that the latest fetched network image is stored on the device
- Every time a new image is fetched, replace the currently saved image on the device
- When the app is opened, if there is a saved image, display it immediately in the UI

Problem 2 – Shared Preferences

Description
Store the user's preference for light or dark theme.

Requirements

- Create a new application with a switch to choose either dark or light theme
- When the switch is changed, save the user's choice using shared preferences
- When the app is opened, determine the theme from the loaded shared preferences setting, if it has been set
    - Think about when this check should be done

Problem 3 – SQLite

Description
A simple contact manager application.

Requirements

- Create a new application that will allow the user to add, edit, and view personal contacts
- The app should have a page with a form for entering new contacts and editing existing contacts
- Create a Contact class that can be used to represent a contact in the system
    - The class should include the following: first name, last name, email address, and phone number
- Save new/edited contacts to a SQLite database on the device
- The app should also have a page to view all contacts
    - You may want to use a list view to display all contacts and then somehow display all contact information when a single contact is selected (e.g. tapped)
